

AUBIN INDUSTRIES, INC. ANTI-STATIC WHEELS

Aubin Industries, Inc. produces an “Anti-Static” wheel product. This means that our wheel will not produce a static charge during operation. It does not mean that they will dissipate static build up from the supported unit.

ESD wheels represent an “Electro Static Discharge” and are also sometimes referred to as a “Conductive” wheel. Electro Static Discharge or Conductive means that static electricity will pass through the wheel to ground. Aubin Industries does not supply ESD or Conductive wheels.

Aubin Industries, Inc. has supplied our Anti-Static wheels to many different companies in the electronics industries, military supply, medical and many more that have had great success with the Aubin Anti-Static wheels. Even with this success we recommend that the end user test the product for their specific environment to ensure they achieve the desired results.
